YORK, ENGLAND.

FIXED EQUATORIAL TELESCOPE, WITH OBJECT GLASS OF 10 INCHES APERTURE.—CLASS 1. Fig. 1.

1886.

ALL PRICES IN OUR PREVIOUS CATALOGUES ARE HEREBY CANCELLED.

ILLUSTRATED CATALOGUE

OF

TELESCOPES,

OBSERVATORIES,

TRANSIT INSTRUMENTS, SPECTROSCOPES, THEODOLITES,

LEVELS, LEVELLING STAVES, CLINOMETERS,

AND OTHER

Astronomical and Scientific Instruments.

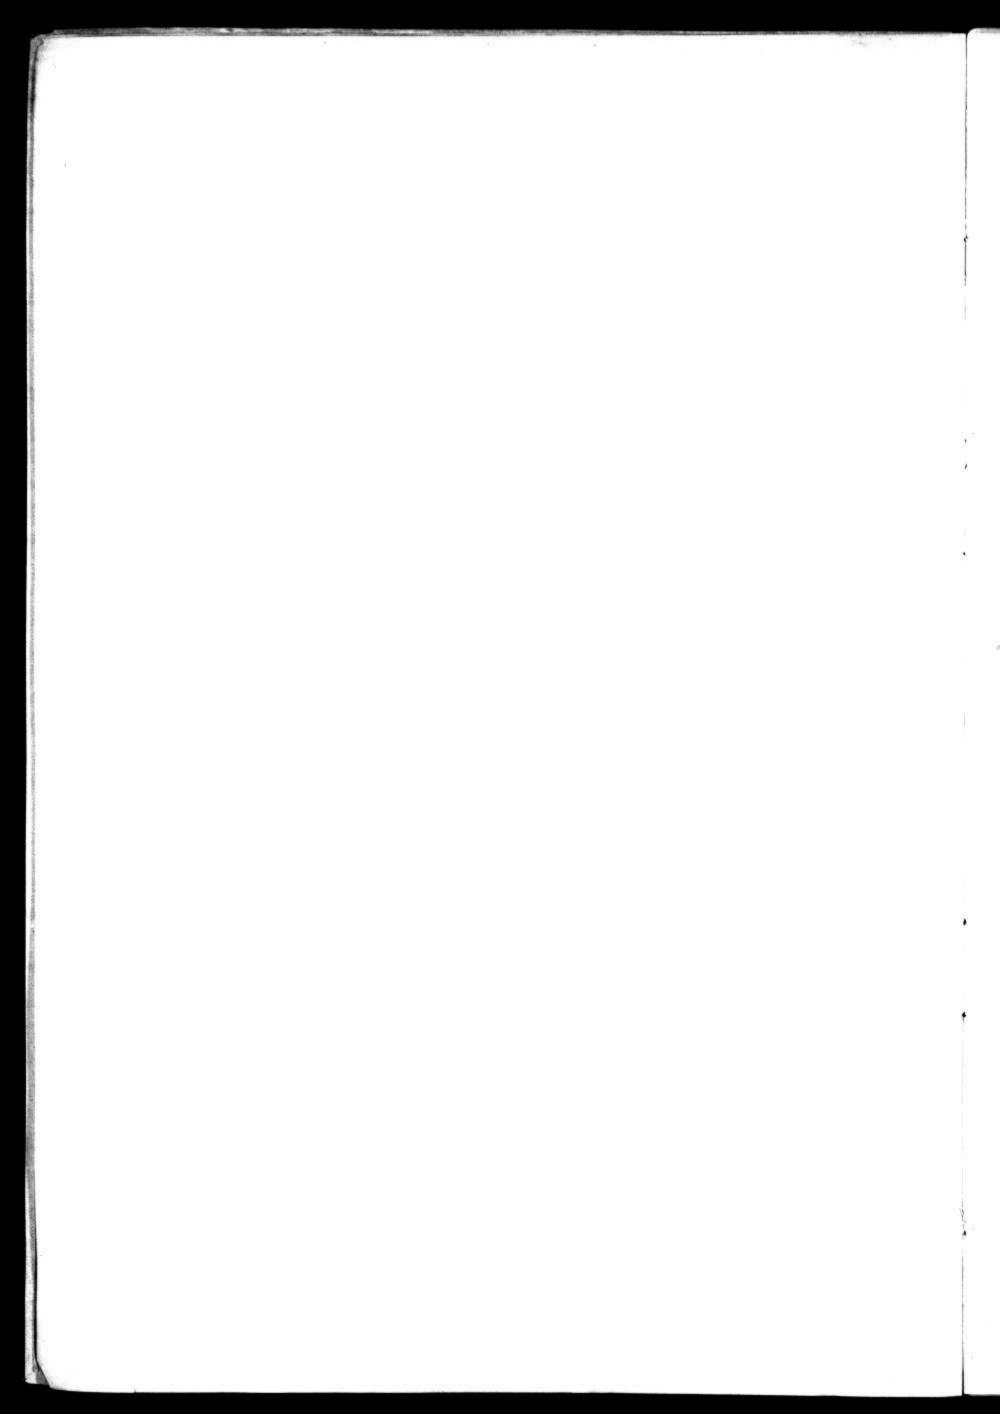

MANUFACTURED BY

T. COOKE & SONS,

BUCKINGHAM WORKS, YORK, ENGLAND.

Hork :

BEN JOHNSON AND COMPANY, PRINTERS, MICKLEGATE.
1886.

FIXED EQUATORIAL TELESCOPES.

EQUATORIAL TELESCOPE, CLASS I, as Frontispiece, complete with—

CAST IRON PILLAR.

STOUT BRASS TUBE, with rack and pinion to eye-end.

FINDER (rack and pinion when fixed to Equatorials over 8 inches aperture).

EVE-PIECES in polished mahogany box (as subjoined list).

FIRST SURFACE REFLECTION PRISM, for viewing the Sun.

STAR DIAGONAL OR TOTAL REFLECTION PRISM.

TRANSIT EVE-PIECE.

BARLOW LENS.

IRIS DIAPHRAGM, fixed in front of the Object-glass for contracting the aperture at will, and worked by a rod brought down to the eye-end.

Dew-Shade with folding shutters worked by a cord from eye-end.

Double Parallel Wire Micrometer, with dark field arrangement and in polished mahogany box (see subjoined list).

PRISMATIC ILLUMINATING APPARATUS, for dark and bright fields of Micrometer, Declination and Position Circle.

Sensitive Level, swinging on pivots attached to the Telescope tube, for determining the horizontal of the Dec. Axis and enabling transits to be taken.

LARGE POSITION CIRCLE at eye-end of the Telescope, graduated on silver, and read by vernier and microscope; with quick and slow motions and clamping arrangements.

DECLINATION CIRCLE of large size, with vernier graduated on silver, and read by microscope from eye-end. Coarse divisions are also placed on the edge of the circle for rough setting.

Fixed Equatorial Telescopes.

HOUR CIRCLE, graduated on silver, with sets of divisions and verniers, reading microscope, and fixed lamp for illumination.

CLOCK for communicating equatorial motion, with means for changing sidereal to lunar rate, and additional slow motions in Right Ascension and Declination by means of rods and handles brought down to the eye-end.

CLAMPING ARRANGEMENTS worked from eye-end.

Polar and Declination Axes of Steel, the pressure on their bearings being relieved by means of friction rollers and counterpoises; the pressure endwise is also relieved by friction rollers. (The anti-frictional arrangement to the Dec. Axis is not introduced in instruments under 10 inches aperture).

SLIDING COUNTERPOISE attached to the upper end of the tube and worked by a screw-rod from the eye-end, for balancing Spectroscope or other heavy appliances.

QUICK MOTION in Right Ascension for rough setting while reading Right Ascension Circle.

Adjustments in Latitude and Azimuth to a considerable extent, with means for setting to great accuracy.

EQUATORIAL TELESCOPE, CLASS II., in general form as frontispiece, with—

CAST IRON PILLAR.

STOUT BRASS TUBE, with rack and pinion to eye-end.

FINDER.

Eye-Pieces and Sunshades in mahogany box (see subjoined list)

FIRST SURFACE REFLECTION PRISM for viewing the Sun.

DEW-SHADE with close-fitting cover.

Prismatic Illuminating Apparatus, for bright field of micrometer and declination circle.

STRIDING LEVEL for declination axis.

Fixed Equatorial Telescopes.

Declination Circle of large size, with vernier graduated on gun metal and read by a microscope from eye-end.

Hour Circle graduated on gun metal, with two sets of divisions and verniers, and read by microscope.

CLOCK for communicating equatorial motion, with means for changing sidereal to lunar rate.

SLOW MOTIONS IN RIGHT ASCENSION AND DECLINATION by means of cords.

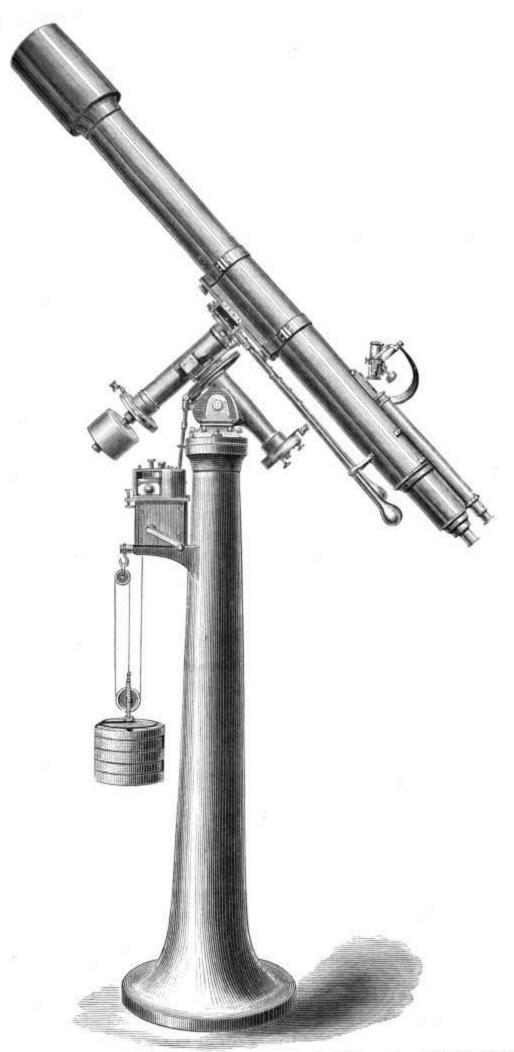

CLAMPING ARRANGEMENTS are also provided.

Polar and Declination Axes of Steel, the former having the pressure on its upper bearing relieved by friction rollers and counterpoises.

ADJUSTMENTS IN LATITUDE AND AZIMUTH to a considerable extent.

Price List of Fixed Equatorial Refracting Telescopes.

Educational Telescopes.

Educational Telescope.

Fig. 5.

BUCKINGHAM WORKS, YORK.

EDUCATIONAL TELESCOPES.

The optical part of these instruments is equal in every respect to that of the more costly Telescopes. The reduction is effected in the mounting only, and in which all superfluous finish is dispensed with. The tube is of brass ("bright black"), mounted on a tall tripod stand, with horizontal and vertical motions, and steadying rods to ensure firmness. The adjustment to focus is effected by means of a draw-tube and rack and pinion motion. Two astronomical eye-pieces, two sun-caps, and dew-cap are supplied with each instrument, and the tube and eye-pieces are fitted into a varnished pine case (see Fig. 5).

CHRONOGRAPHS.

From this Illustration (Fig. 11) will be seen the principle upon which this instrument is constructed. The two electro magnets for working the pens are mounted on a roller carriage

Chronographs.

Cylindrical Form of Electrically Controlled Chronograph.

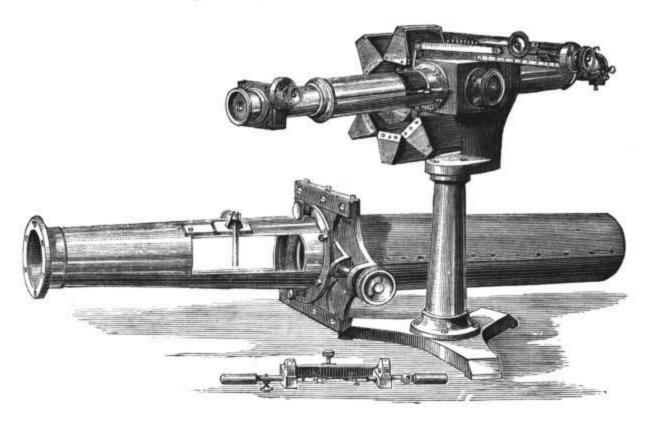

Fig. 11.

travelling on a light slide fixed in front of the cylinder; this carriage is moved along by means of a screw working with the cylinder, which revolves by means of clockwork. As the cylinder rotates lines are traced on the paper covering it by the pens moving along with the carriage; one of the pens is in connection with an astronomical clock, and marks on the paper seconds of time; the other is under the control of the observer, who sends a current at the instant desired by means of contact key.

By this means a correct registration of time is kept, and may be read off to a great degree of accuracy by comparison of the two sets of tracings. The advantage of such a controlling system is obvious from the facility with which the observations are afterwards read off; for one revolution of the cylinder being completed in exactly one minute, a straight line drawn across the cylinder will mark each succeeding minute. The price of this Instrument complete, with one cylinder, £60; extra cylinders (each), £5.

Specifications and Estimates for any other form of Chronograph will be furnished on application.

SPECTROSCOPES.

Direct Vision Automatic Solar Spectroscope.

Fig. 12.

 \pounds s. d.

94 DIRECT VISION SOLAR SPECTROSCOPE, (Fig. 12,) with—

SIX PRISMS.

DISPERSIVE Power, equivalent to 2, 4, 6, 8, 10, or 12 prisms; changeable from one power to another.

AUTOMATIC MOVEMENT of the prisms, for the minimum angle of deviation for the part of the spectrum under examination.

MEASURING APPARATUS, for the position of the lines, by a micrometer screw and divided head, connected with the chain of prisms.

Spectroscopes.

No.

£ s. d.

FILAR MICROMETER, for delicate differential measurements, with revolution counter and small mirror on universal joint for directing the light on to the webs.

FOUR ACROMATIC MICROMETER EYE-PIECES.

Telescope and Collimator Objectives, I inch clear aperture. Their adjustment to focus on the different parts of the spectrum is effected simultaneously by rack and pinion.

SLIT, with two movable jaws and edged with platinum.

COMPARISON SPECTRUM PRISM in front of slit.

ADAPTER OF SOLAR SWEEPING APPARATUS, with eccentric orbital and rotatory motions.

INSULATED SPARK APPARATUS and TUBE-HOLDER.

Brass Tripod and Pillar Stand, for supporting the instrument when used on a table.

Packed in mahogany case, complete -

87 0 0

95 DIRECT VISION SPECTROSCOPE, with

ONE COMPOUND PRISM (consisting of five).

Telescope and Collimator, objectives \(\frac{3}{4} \) inch clear aperture.

RACK and PINION, focussing adjustment to Telescope.

Two Achromatic Eve-Pieces.

SLIT, with platinum edges.

COMPARISON SPECTRUM PRISM attached to slit.

DIVIDED GUN-METAL ARC.

Spectroscopes.

No.

£ s. d.

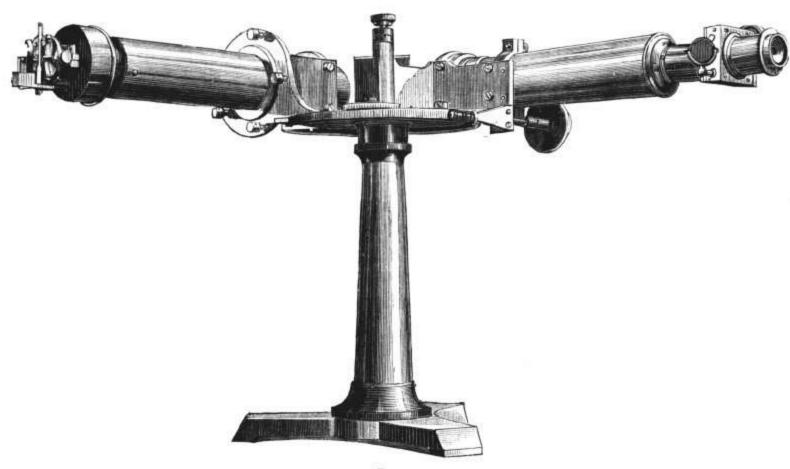

TANGENT-SCREW MOTION.

Draw-tube Adapter, for attaching the instrument to a Telescope.

Brass Tripod Pillar Stand, with hinged clasp, for supporting the Spectroscope when used on a table.

Packed in mahogany case, complete

EYE-PIECES, MICROMETERS, &c.

Polarizing Solar Eye-pieces. Fig. 16.

No.

POLARIZING SOLAR EYE-PIECE (see Fig. 16)

The principle of this eye-piece depends upon a curious property of light discovered by M. Malus in 1808, viz., the polarization of light at plane surfaces of transparent bodies.

The eye-piece consists of two reflecting surfaces receiving the solar rays successively; the surface nearer the eye has a rotatory motion, but always keeps the same reflecting angle with the other surface. By turning the former surface quarter-way round, it appears to almost entirely lose its power of reflection, the rays of light being said to be "polarized by reflection;" the sun's light can thus be diminished without any distortion of the object, and without disturbing the natural tints by coloured glasses.

S.

d.

Eye-pieces, Micrometers, &c.

Often a third or fourth reflector is introduced, and by a single rotation of the one nearest the eye the light is diminished at will; thus the sun

may be viewed for hours together without the

slightest pain to the eyes.

123 Do. do. with three reflecting surfaces - 8 o o

124 Do. do. with four reflecting surfaces - - 10 0 0

125 DAWES'S SOLAR EYE-PIECE - - 8 o d

A special eye-piece for the sun, devised by the late Mr. Dawes, consisting of a revolving circular metallic plate, faced on the inner side with ivory, containing a series of apertures of various sizes, from $\frac{1}{130}$ to $\frac{1}{2}$ an inch; these serve to limit the field ad libitum, and the field so curtailed is examined by single lenses mounted on another plate revolving concentrically with the former one. Superposed upon the wheel of single lenses is another wheel, containing a series of dark glasses of various shades, to suit the eye and magnifying power used. The single lenses are focused on the apertures in the diaphragm by a rack and pinion movement. It is admirably adapted for solar observation, and for general celestial purposes, such as the examination of a faint sidereal object, without the presence of a more luminous neighbour.

	This is a diagonal eye-piece, and consists of a tube (sliding into the Telescope tube at the eye-end) with another tube let into it at right angles. In the main tube, at an angle of 45° to the axis and opposite to the secondary tube, is a prism, and the image of the sun diverted by reflection from the first surface of this prism is viewed through an ordinary eye-piece placed in the secondary tube. The loss of light by reflection is no disadvantage, but the reduction of light and heat by this arrangement is not sufficient to obviate the use of a sun-shade of coloured glass.

ASTRONOMICAL OBSERVATORIES.

Astronomical Observatory with Transit Room attached. Fig. 27.

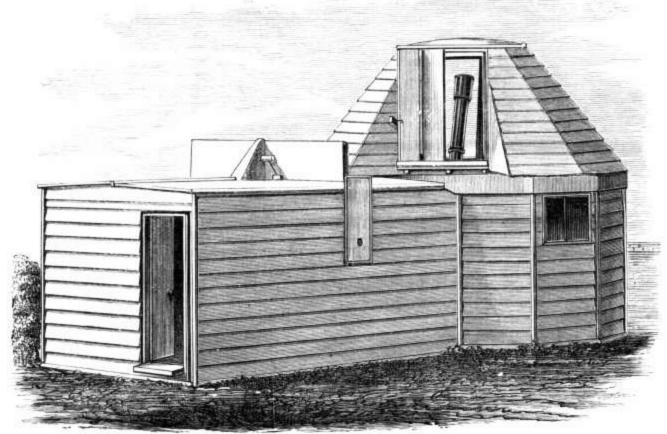

In constructing an Observatory it is essential that a suitable form be selected, in order that perfect freedom of motion for the Instruments may be secured without unnecessary waste of space or material.

In order to aid those who are contemplating the erection of such a building, we beg to call attention to two forms of Observatories made by us, the one suitable for Telescopes of apertures exceeding 6 inches; the other a simpler form for less expensive instruments.

Fig. 27 is an Observatory with Transit room attached. The form is octagonal, the overhanging eaves and iron rail upon which the dome revolves being supported in the interior at each angle

Astronomical Observatories.

by cast iron pillars which are let into the stone work surrounding the basement of the building, the foundation of which is of brick. The sides are constructed of redwood boards; the framework of the dome is also of redwood, which is covered with canvas thoroughly painted to withstand the weather; this covering has the advantage of being light, and thus renders the dome, which rests upon seven cast iron wheels working on a circular rail, capable of being turned round with comparative ease. The shutter of the dome is divided longitudinally through the centre, and the two halves move on rails equably from the centre by means of a pinion and double rack.

Astronomical Observatory, with Transit Room attached. Fig. 28.

Fig. 28. A less expensive form of Observatory; has also a Transit room attached (this should always be done if possible, as by a comparatively small extra outlay at first much expense is saved should the Transit room be afterwards required). The

Astronomical Observatories.

whole of the building is of redwood, lightly but well put together, and is all that can be desired for equatorials of under six inches aperture. Care should be taken, however, that the pillar of the Telescope rests upon a sufficiently firm foundation.

It being almost impossible to give estimates for Observatories without previously knowing the apertures of the Telescopes for which they are required, we have refrained from publishing a series of estimates, feeling that however large we might make the series it would at best be unsatisfactory. We shall be glad, however, to send specifications and estimates to anyone upon being furnished with the necessary particulars.
